Plants in Action 2nd edition

Contents Page

- About the textbook
  - **Contents Page**
  - Chapter 1 - Light use and leaf gas exchange
    - 1.1 - Leaf anatomy, light interception and gas exchange
      - 1.1.1 - Leaf Structure
      - 1.1.2 - Light absorption
      - 1.1.3 - CO_2 diffusion to chloroplasts
      - 1.1.4 - Light and CO_2 effects on leaf photosynthesis
    - Case Study 1.1 - Development of A:C_i curves
    - 1.2 - Chloroplasts and energy capture
      - 1.2.1 - Chloroplast structure and composition
      - 1.2.2 - Chlorophyll absorption and photosynthetic action spectra
      - 1.2.3 - Cooperative photosystems and a 'Z' scheme for electron flow
      - 1.2.4 - ATP synthesis
      - 1.2.5 - Chlorophyll fluorescence
    - Case Study 1.2 - Five chlorophylls and photosynthesis
    - 1.3 - Concluding remarks
    - 1.4 Further reading
  - Chapter 2 - Carbon dioxide assimilation and respiration
    - 2.1 - C_3 photosynthesis
      - 2.1.1 - Photosynthetic carbon reduction
      - 2.1.2 - RuBP regeneration
      - 2.1.3 - Properties of Rubisco
    - Feature essay 2.1 - The discovery of C_4 photosynthesis
    - 2.2 - C_4 and CAM photosynthesis
      - 2.2.1 - Evolution of C_4 photosynthesis
      - 2.2.2 - The CO_2 concentrating mechanism in C_4 photosynthesis
      - 2.2.3 - Energetics of C_4 photosynthesis

- 2.2.4 - The biochemical subtypes of C_4 photosynthesis
- 2.2.5 - Environmental physiology of C_3 versus C_4 photosynthesis
- 2.2.6 - Single-cell C_4 photosynthesis
- 2.2.7 - C_3-C_4 photosynthesis
- 2.2.8 - Crassulacean acid metabolism (CAM)
  - 2.2.8.1 - Biochemical attributes distinctive to CAM
  - 2.2.8.2 - Physiological attributes distinctive to CAM
  - 2.2.8.3 - Ecological attributes distinctive to CAM
  - 2.2.8.4 - Speculations on the origins of CAM
  - 2.2.8.5 - References for CAM
- 2.2.9 - Submerged aquatic macrophytes (SAM)
- 2.10 References for photosynthesis

- 2.3 - Photorespiration
  - 2.3.1 - History of photorespiration research
  - 2.3.2 - Photorespiration needs three organelles
  - 2.3.3 - C_4 plants and unicellular algae avoid photorespiration
  - 2.3.4 - Does photorespiration represent lost productivity?
  - 2.3.5 - References for photorespiration
- 2.4 - Respiration and energy generation
  - 2.4.1 - Starch and sucrose degradation
  - 2.4.2 - The glycolytic pathway
  - 2.4.3 - The oxidative pentose phosphate pathway
  - 2.4.4 - Mitochondria and organic acid oxidation (the TCA cycle)
  - 2.4.5 - Electron transport chain
  - 2.4.6 - ATP synthesis (oxidative phosphorylation)
  - 2.4.7 - Alternative electron transport pathways
  - 2.4.8 - Energetics of respiration
  - 2.4.9 - Further Reading

- Chapter 3 - Water movement in plants
  - 3.1 - Plant water relations
    - 3.1.1 - The power of turgor pressure

        - 3.1.2 - Osmotic pressure and water potential
        - 3.1.3 - Positive and negative hydrostatic pressures
        - 3.1.4 - Turgor loss, cytorrhysis, and plasmolysis
        - 3.1.5 - What drives water flow?
        - 3.1.6 - The influence of gravity
        - 3.1.7 - Definitions and further reading
    - 3.2 - Long distance xylem transport
        - 3.2.1 - Cohesion Theory for the Ascent of Sap
        - 3.2.2 - Xylem as an effective conduit for sap
        - 3.2.3 - Axial flow in the xylem - where does it start?
        - 3.2.4 - Solutes in xylem sap
    - 3.3 - Leaf vein architecture and anatomy
        - 3.3.1 - Vein architecture of conifers and angiosperms
        - 3.3.2 - Damage control
        - 3.3.3 - Water extraction from the xylem
        - 3.3.4 - Solute extraction from the xylem
    - 3.4 - Water movement from soil to roots
        - 3.4.1 - Water in soils
        - 3.4.2 - Water in pots
        - 3.4.3 - Uptake of water by roots
        - 3.4.4 - Soil:root interface
    - 3.5 - Water and nutrient transport through roots
        - 3.5.1 - Radial pathways across roots
        - 3.5.2 - Variable barriers: endodermis and exodermis
        - 3.5.3 - Relation between water and nutrient flux
    - 3.6 - Membrane transport of water and ions
        - 3.6.1 - Diffusion and permeability
        - 3.6.2 - Chemical potential
        - 3.6.3 - Ions, charge and membrane voltages
        - 3.6.4 - Aquaporins (water channels)
- 3.7 - References

- Chapter 4 - Nutrient uptake from soils
  - 4.1 - Nutrient requirements and root architecture
    - 4.1.1 - Plant nutrition
    - 4.1.2 - Root system architecture
    - Definitions
    - Case Study 4.1 - Cluster (proteoid) roots
  - 4.2 - Soil-root interface
    - 4.2.1 - The rhizosphere
    - 4.2.2 - Rhizosphere chemistry
    - 4.2.3 - Rhizosphere biology
    - 4.2.4 - Costs and benefits of a rhizosphere
  - 4.3 - Mycorrhizal associations
    - 4.3.1 - Main types of mycorrhizas
    - 4.3.2 - Development and structure of mycorrhizas
    - 4.3.3 - Functional aspects of mycorrhizas
  - Case Study 4.2 - Regulation of legume nodule numbers
  - 4.4 - Symbiotic nitrogen fixation
    - 4.4.1 - Acquiring atmospheric nitrogen
    - 4.4.2 - A range of N_2-fixing associations
    - 4.4.3 - Rhizobium associations
    - 4.4.4 - The Rhizobium-legume symbiosis is fine-tuned by a molecular dialogue
    - 4.4.5 - Linking functions with structures
    - 4.4.6 - Measuring N_2 fixation
  - 4.6 - References
- Chapter 5 - Phloem transport
  - 5.1 - Distribution of photoassimilates within plants
    - 5.1.1 - Source–path–sink transport processes
    - 5.1.2 - Photoassimilate transport and biomass production
    - 5.1.3 - Whole-plant distribution of photoassimilate
  - 5.2 - Phloem transport

        - 5.2.1 - Phloem structure and function
        - 5.2.2 - Techniques to collect phloem sap
        - 5.2.3 - Chemical nature of translocated material
        - 5.2.4 - Phloem flux
        - 5.2.5 - Control of assimilate transport from source to sink
    - 5.3 - Phloem loading
        - 5.3.1 - Pathway of phloem loading in source leaves
        - 5.3.2 - Mechanisms of phloem loading
        - 5.3.3 - Sink regulation of phloem loading
    - 5.4 - Phloem unloading and sink utilisation
        - 5.4.1 - Cellular pathways of phloem unloading
        - 5.4.2 - Mechanisms of phloem unloading
        - 5.4.3 - Sugar metabolism and compartmentation in sinks
        - 5.4.4 - Key transfer events in sugar metabolism and compartmentation
        - 5.4.5 - Sink control of photoassimilate partitioning
        - 5.4.6 - Follow the flow: unloading of water and its destination
    - 5.5 - References
- Chapter 6 - Growth analysis: a quantitative approach
    - 6.1 - Concepts and components of RGR
        - 6.1.1 - Cell populations
        - 6.1.2 - Plant biomass
    - 6.2 - Environmental impacts on RGR
        - 6.2.1 - Light
        - 6.2.2 - Temperature
        - 6.2.3 - Carbon dioxide
    - 6.3 - Vegetative growth and development
        - 6.3.1 - Patterns of leaf growth
        - 6.3.2 - Root:shoot ratios
        - 6.3.3 - Allometry
    - 6.4 - Reproductive development

        - 6.4.1 - Harvest index
        - 6.4.2 - Yield components
        - 6.4.3 - Increasing harvest index
    - 6.5 - Respiratory efficiency and plant growth
        - 6.5.1 - Processes of energy generation and utilisation
        - 6.5.2 - Fast-growing versus slow-growing plants
        - 6.5.3 - Maintenance versus growth respiration
        - 6.5.4 - Suboptimal environments
    - 6.6 - References
- Chapter 7 - Plant growth and reproduction
    - 7.1 - Axial growth: root, shoot and leaf development
        - 7.1.1 - Root apical meristems
        - 7.1.2 - Shoot apical meristems
        - 7.1.3 - Leaf development
    - Case Study 7.1 - The significance of cell walls
- Chapter 11 - Fruit growth, ripening and post-harvest physiology
    - 11.1 - Origin of fruit tissues and fruit set
    - 11.2 - Dynamics of fruit growth
        - 11.2.1 - Cell division and enlargement
        - 11.2.2 - Cell differentiation
        - 11.2.3 - Seed development and fruit growth
    - 11.3 - Resources for fruit growth
        - 11.3.1 - Photoassimilate distribution
        - 11.3.2 - Composition of photoassimilates
        - 11.3.3 - Fruit composition and sensory attributes
        - 11.3.4 - Mineral nutrients
    - 11.4 - Carbon accumulation
        - 11.4.1 - Sugar storage
        - 11.4.2 - Starch storage
    - 11.5 - Fruit ripening
        - 11.5.1 - Ethylene and the regulation of ripening

        - 11.5.2 - Developmental control of ripening
        - 11.5.3 - Texture and softening
        - 11.5.4 - Colour and flavour
    - Feature Essay - 11.1 A century of ethylene research
    - 11.6 - Extending storage life
        - 11.6.1 - Temperature and relative humidity
        - 11.6.2 - Controlled and modified atmospheres
        - 11.6.3 - Blocking ethylene action
        - 11.6.4 Storage disorders
    - 11.7 - Future technologies
    - 11.8 - Concluding remarks
    - 11.9 - Further reading and literature cited
- Chapter 12 - Sunlight and plant production
    - 12.1 - Photosynthesis in sun and shade
        - 12.1.1 - Light interception and utilisation
        - 12.1.2 - Photoinhibition and photoprotection
        - 12.1.3 - Sun/shade acclimation and rainforest gaps
        - 12.1.4 - Sunflecks and photosynthesis dynamics
    - Feature essay 12.1 - Perspectives on photoprotection and photoinhibition
    - 12.2 - Agricultural production and light
        - 12.2.1 - Leaf area index and canopy light climate
        - 12.2.2 - Light use efficiency
    - 12.3 - Forest production and light
        - 12.3.1 - Canopy architecture and light interception
        - 12.3.2 - Canopy productivity
    - Case study 12.1 - Pine forest production and light use efficiency
    - 12.4 - Light and horticultural production
        - 12.4.1 - Light interception
        - 12.4.2 - Light and fruit quality
        - 12.4.3 - Light, flower bud differentiation and fruit set

        - 12.4.4 - Orchard design, canopy management and light interception
    - 12.5 - Ultraviolet radiation
        - 12.5.1 - Ultraviolet radiation and plant biology
    - 12.6 - Conclusion and references
- Chapter 14 - Temperature and acclimation
    - 14.1 - Thermal environment and plant heat budgets
        - 14.1.1 - Temperature means and extremes
        - 14.1.2 - Plant temperatures
        - 14.1.3 - Plant energy budgets
    - 14.2 - Growth and development responses to temperature
        - 14.2.1 - Plant variation in sensitivity to temperature
        - 14.2.2 - Thermal time and crop development
        - 14.2.3 - Photothermal Quotient (PTQ) predicts potential crop yield
    - 14.3 - Responses of enzymes, photosynthesis and assimilate transport
        - 14.3.1 - Photosynthesis
        - 14.3.2 - Assimilate transport
        - 14.3.3 - Biochemistry and basic concepts
    - 14.4 - Chilling injury
        - 14.4.1 - Symptoms of chilling injury
        - 14.4.2 - Quantifying chilling injury
        - 14.4.3 - Ranges of chilling tolerance
        - 14.4.4 - Chill hardening
    - 14.5 - Plant responses to cold
        - 14.5.1 - Cold sensing and signal transduction
        - 14.5.2 - Changes in gene expression underpinning cold acclimation
        - 14.5.3 - Cold-induced changes in membrane characteristics and metabolic profiles
        - 14.5.4 - Cold responses of photosynthesis
        - 14.5.5 - Increased respiratory capacity in cold acclimated plants

        - 14.5.6 - Further Reading
    - 14.6 - Frost and freezing injury
        - 14.6.1 - Physics and physiology
        - 14.6.2 - Alleviating frost damage in horticulture
        - Case Study 14.1 - Cold-induced photoinhibition and tree regeneration
    - 14.7 - High temperature stress
        - 14.7.1 - Plant response to high temperature
        - 14.7.2 - Heat avoidance
        - 14.7.3 - Heat injury and inhibition
        - 14.7.4 - Heat tolerance
        - 14.7.5 References
    - 14.8 - Concluding remarks
- Chapter 18 - Waterlogging and submergence
    - 18.1 - Soil aeration, redox chemistry, soil toxins and changes in nutrients
        - Case Study 18.1: Rice ecotypes and systems
    - 18.2 - Water chemistry of floods causing complete submergence
    - 18.3 - Biochemical and metabolic adaptations
        - Case Study 18.2: Rice coleoptiles - an excellent model for studies on oxygen deprivation
        - 18.3.1 - Root respiration and anaerobic metabolism
        - Case Study 18.3 - Can plants sense oxygen?
        - 18.3.2 - Reactive oxygen species
        - 18.3.3 - Nutrient acquisition by roots in waterlogged soil
    - 18.4 - Internal aeration - aerenchyma and morphological adaptations
        - 18.4.1 - Aerenchyma in roots
        - 18.4.2 - Through-flows of O2 along rhizomes of some wetland plants
        - 18.4.3 - Specialised roots for flooded environments
    - 18.5 - Complete submergence - escape or quiescence responses
        - 18.5.1 - Photosynthesis under water

        - Case Study 18.4 - Photosynthesis and internal aeration in submerged aquatic plants
        - 18.5.2 - Internal aeration when completely submerged
    - 18.6 - Recovery when waters recede
        - 18.6.1- Shoot desubmergence
        - 18.6.2 - Soil drainage following waterlogging
- 18.7 - References
